

Mahathir Mohammad Shuvo

Full-Stack Software Engineer

Dhaka, Bangladesh | shuvo1728@gmail.com | +880 1743 078887 | linkedin.com/in/mahathir-mohammad-shuvo | github.com/MahathirMohammadShuvo

SUMMARY

Full-stack engineer with six years of professional experience shipping production systems across web, mobile and desktop. Works daily in TypeScript and Python across four concurrent production codebases - REST and WebSocket backends, React and React Native front ends and an Electron desktop app - and also writes Java and C++. Owns systems end to end: schema and API design, real-time features, payments, CI to the app stores, automated testing and production monitoring. Open-source contributor with 11 pull requests merged upstream into PDFKit and Hono.

TECHNICAL SKILLS

Languages: Python, TypeScript, JavaScript, Java, C++
Backend: NestJS, Node.js, Express, Flask, Django, Prisma, REST APIs, WebSockets, Socket.IO, Zod
Databases: PostgreSQL, MySQL, MongoDB, Redis, Elasticsearch, SQLAlchemy
Frontend: React, TanStack Router/Query/Table/Form, Redux, Zustand, Tailwind CSS, Radix UI, Vite
Mobile / Desktop: React Native (Expo), Electron, Codemagic CI, EAS Build
AI: Model Context Protocol (MCP), LangGraph, Anthropic API, RAG, Hugging Face Transformers, TensorFlow.js
Cloud / DevOps: AWS, Google Cloud Platform, Docker, nginx, Apache, PM2, GitHub Actions, Vercel, Netlify
Security / Testing: JWT, OAuth, bcrypt, WebCrypto; Playwright, Vitest, Jest, Mocha
Other: WebRTC (mediasoup, LiveKit), web scraping, Google Maps API, Stripe, PDF and Excel generation

EXPERIENCE

Software Engineer

Apr 2024 - Present

Confidential client under NDA - Remote

- Develop a large TypeScript monorepo spanning HTTP backend, web app, admin console, mobile and desktop clients, with roughly a quarter of the codebase being automated tests.
- Ship a cross-platform Electron desktop app with signed auto-updates and PDF processing; integrate biometric identity verification (AWS Rekognition, Amplify Liveness, TensorFlow.js).
- Diagnose and fix defects across unfamiliar third-party code, and implement metered billing, subscriptions and payouts with Stripe against a rate-limited public API with key management.

Full-Stack Developer

2020 - Mar 2024

DKERPS - Remote

- Sole backend developer across five products, owning deployment, testing and architecture on several concurrently.
- Built a Flask/SQLAlchemy large-file transfer service supporting single transfers up to 40 GB, on GCP with Ubuntu and Apache.
- Built Dropbox-style cloud storage with shared folders, business accounts and per-member permissions, on AWS with nginx at 99% uptime; and a centralised log-management system on Elasticsearch.
- Built a Zoom-style conferencing app (MERN, mediasoup WebRTC) and delivered a React Native (Expo) scheduling app - 100% of backend, 70% of frontend.

PROJECTS

- Discount Bajar (discount-bajar.com) - live e-commerce platform. Four apps on one NestJS/Prisma/PostgreSQL backend: React web, admin console, Expo app for iOS and Android, and workers. Double-entry accounting with bank reconciliation, rider dispatch, referral and reward engine, recommendation engine, RAG product search, real-user monitoring.
- AI Employees - self-hosted multi-agent platform. Agents organised as a company collaborating over the Model Context Protocol; LangGraph orchestration with a PostgreSQL checkpointer, Redis-backed Socket.IO, React UI with Monaco editor and node-graph monitoring.

OPEN SOURCE

- PDFKit (foliojs/pdfkit, 10.7k stars) - eight merged pull requests: AcroForm date fields emitting invalid JavaScript so formatting never applied; indentAllLines applying the indent repeatedly across paragraphs and page breaks; table cell fonts inheriting an unrelated family; undefined option values serialising as the literal token; a hole in a sparse array shifting every later entry down one; and a missing embedded-file ref writing an unparseable token into the name tree.
- Hono (honojs/hono, 32.0k stars) - two merged pull requests, both landed by the project's creator: an undefined entry inside a query array going out on the wire as the literal string undefined, and a parameter whose value is the string index being stripped from generated URLs.
- OpenCV (opencv/opencv, 90.6k stars) - one merged pull request: FaceRecognizerSF::match normalised its two InputArray features in place, so a const method wrote through to the caller's buffers and returned a wrong score when the two overlapped.
